### Informazioni su questo libro

Si tratta della copia digitale di un libro che per generazioni è stato conservata negli scaffali di una biblioteca prima di essere digitalizzato da Google nell'ambito del progetto volto a rendere disponibili online i libri di tutto il mondo.

Ha sopravvissuto abbastanza per non essere più protetto dai diritti di copyright e diventare di pubblico dominio. Un libro di pubblico dominio è un libro che non è mai stato protetto dal copyright o i cui termini legali di copyright sono scaduti. La classificazione di un libro come di pubblico dominio può variare da paese a paese. I libri di pubblico dominio sono l'anello di congiunzione con il passato, rappresentano un patrimonio storico, culturale e di conoscenza spesso difficile da scoprire.

Commenti, note e altre annotazioni a margine presenti nel volume originale compariranno in questo file, come testimonianza del lungo viaggio percorso dal libro, dall'editore originale alla biblioteca, per giungere fino a te.

### Linee guide per l'utilizzo

Google è orgoglioso di essere il partner delle biblioteche per digitalizzare i materiali di pubblico dominio e renderli universalmente disponibili. I libri di pubblico dominio appartengono al pubblico e noi ne siamo solamente i custodi. Tuttavia questo lavoro è oneroso, pertanto, per poter continuare ad offrire questo servizio abbiamo preso alcune iniziative per impedire l'utilizzo illecito da parte di soggetti commerciali, compresa l'imposizione di restrizioni sull'invio di query automatizzate.

Inoltre ti chiediamo di:

+ *Non fare un uso commerciale di questi file* Abbiamo concepito Google Ricerca Libri per l'uso da parte dei singoli utenti privati e ti chiediamo di utilizzare questi file per uso personale e non a fini commerciali.
+ *Non inviare query automatizzate* Non inviare a Google query automatizzate di alcun tipo. Se stai effettuando delle ricerche nel campo della traduzione automatica, del riconoscimento ottico dei caratteri (OCR) o in altri campi dove necessiti di utilizzare grandi quantità di testo, ti invitiamo a contattarci. Incoraggiamo l'uso dei materiali di pubblico dominio per questi scopi e potremmo esserti di aiuto.
+ *Conserva la filigrana* La "filigrana" (watermark) di Google che compare in ciascun file è essenziale per informare gli utenti su questo progetto e aiutarli a trovare materiali aggiuntivi tramite Google Ricerca Libri. Non rimuoverla.
+ *Fanne un uso legale* Indipendentemente dall'utilizzo che ne farai, ricordati che è tua responsabilità accertati di farne un uso legale. Non dare per scontato che, poiché un libro è di pubblico dominio per gli utenti degli Stati Uniti, sia di pubblico dominio anche per gli utenti di altri paesi. I criteri che stabiliscono se un libro è protetto da copyright variano da Paese a Paese e non possiamo offrire indicazioni se un determinato uso del libro è consentito. Non dare per scontato che poiché un libro compare in Google Ricerca Libri ciò significhi che può essere utilizzato in qualsiasi modo e in qualsiasi Paese del mondo. Le sanzioni per le violazioni del copyright possono essere molto severe.

# PREFACE.

**The** publication of this volume completes the third and last part of the Cape Photographic Durchmusterung, and it remains for me only to acknowledge the aid and the services of those who have contributed to this end.

In connection with the photographic part of the work, I am indebted to the Government Grant Fund of the Royal Society for financial aid, sufficient to cover the cost of an assistant's services during two and a half years.

To Mr. C. Ray Woods (who was engaged in the work as my private assistant from the beginning of 1885 till the 31st of September 1889, and afterwards as a member of the Observatory Staff till completion of the work in 1891), I would here express my sense of his deep interest in the undertaking, and of his devotion and skill in the discharge of his duties.

Mr. R. T. A. Innes (whose official duties are those of Secretary, Librarian and Accountant at this Observatory), has, as a labour of love, devoted himself since April 1896 to the work of revision which is summarized in the Introduction. I most gratefully acknowledge his valuable services.

But it is my colleague and friend, whose name appears on the title page, to whom I am under the deepest obligation. At a time of great stress and discouragement he lifted from my shoulders a load of responsibility by his noble and spontaneous offer to undertake the measurement of the plates, the computation of the results, and the formation of the catalogue. He realized from the first the advantages and possibilities of the work, as well as the need for it in the present state of science, and he devoted over twelve of the best years of his life to the fulfilment of his undertaking. I now realize that my many other duties, and the difficulty of obtaining adequate assistance, would probably have compelled me to defer a great part of the work of the catalogue to the years of my retirement from official life, and might even have prevented its completion.

I feel assured that Kapteyn has not laboured in vain, and that astronomers will duly appreciate what he has done for their science.

Such language on the part of one joint author in regard to the work of the other is perhaps unusual. It can only be justified by the immensely greater share of the whole, and the distinctive character of the work done by Kapteyn—and how much greater has been his share than mine can only be appreciated by those who are acquainted with the technicalities of similar work.

## PART III.

## INTRODUCTION.

In Part I. of this work Kapteyn has given the following lists :—

I. List of Stars contained in the Catalogues of Precision, and missing on the C.P.D. plates.
II. List of Stars, 9·0 magnitude or brighter, contained in Schönfeld's Durchmusterung, and missing on the C.P.D. plates.
III. List of Stars of 9th photographic magnitude or brighter, contained in the C.P.D., and missing in Schönfeld's Durchmusterung.

Of these lists Nos. II. and III. are completed in Part I.

List I. is continued in Kapteyn's Introductions to Parts II. and III.

The following additional lists are given in Kapteyn's Introduction to Part III :—

II. *bis.*, List of Stars, 9·0 magnitude or brighter, contained in the first two parts of Thome's Durchmusterung, and missing on the plates of the C.P.D.
III. *bis.*, List of Stars, 9·2 photographic magnitude or brighter, contained in the C.P.D., and missing in Thome's Durchmusterung.

Similar lists have been forwarded from time to time by Kapteyn, and the questions suggested by them have been examined by Mr. Innes with the aid of the 7-inch equatorial of the Cape Observatory. Meridian and photographic observations have also been made in many cases, the former in connection with questions of proper motion, the latter generally in connection with variable stars which fall below the range of easy visibility with the 7-inch equatorial. It is impossible, within the limits of an introduction of reasonable length, to give an adequate account of this revision. For example, many variable stars, or stars suspected of variability, have been observed on from thirty to one hundred nights each. As the last of Kapteyn's lists was only recently received, it is evident that many of the questions raised cannot yet be completely settled; but, as Part III. of the C.P.D.

Digitized by Google

deals with a portion of the sky of which no complete survey at present exists, it seems undesirable to delay its publication until the revision is complete.

We have therefore decided to publish this third, and last, part of the C.P.D. in the form in which it emanates from Kapteyn's hands, adding only, on the most condensed possible plan, the results of the Cape revision up to the present date, leaving complete detailed results of the revision, and the separate observations of variable stars, for subsequent publication.

As indicated in Part I., the following further researches form part of the complete scheme:—

1. A list of errors in the Catalogues of Precision which have been compared with the C.P.D.
2. A list of large and previously unknown proper motions.
3. A list of new variable stars.
4. A further investigation on the systematic difference of colour between the stars of the Milky Way and those of higher galactic latitude.
5. An investigation of the systematic corrections which should be applied to the magnitudes of each of the C.P.D. plates, in accordance with the plan proposed in Part I. p. xxx.

A great deal of work has been done both at Groningen and the Cape in connection with all these researches excepting the last, and these will be published so soon as they are completed—probably about a year hence. The last mentioned investigation cannot be taken in hand until the Cape's share of the international astrographic charts has been completed, and the 13-inch astrographic telescope is at disposal for new work.

As the most compact plan for presenting the preliminary results of the Cape revision, an endeavour is made to classify the answers to questions raised in each of Kapteyn's lists under the following heads:—

1. No star can be seen in the given position.
2. A star of 9th magnitude or brighter exists in the position stated. (See also coloured stars, heads 4 or 5.)
3. A star, fainter than 9th magnitude, exists in the position stated. (See also coloured stars, heads 4 or 5.)
4. The star is coloured—yellow to orange.
5. The star is coloured—orange-red to deep red.
6. The star is variable.
7. There is an explained misprint or mistake in the original catalogue.
8. Miscellaneous.

The number of the star in Kapteyn's list to which the particular answer is applicable is given in order under one of these heads. A coloured star appears under two heads.

The number is included in brackets when there is any remaining doubt.

Nos. 3, 44, 60, 61, 68, 77, 95, 103, 125, 150, 163, 166, 170, 174, 176, 177, 227, 232, 241, 244, 253, 256, [263], [272], 274, 275, 280, 283, 285, 286, 290, 292, 298, 326, 341, 349, [483], [484], 486, 502, [516], [522], 554, 560, 565, [569], 574, 578, 589, 599, 604, [610], 611, 618, 621, 623, 624, 630, 633, 634, 635, 636, [638], 644, [651], 659, 663, [669], 682, 693, 714, [716], 723, 726, 736, 743, 760, [772], 781, [782], 858, [874], 930, [931], 959.

## 6. Star is variable.

Nos. 68, 69, 77, 99, 103, 104, 122, 126, 132, 136, 149, 184, 185, 204, 209, 210, 214, 219, 259, 338, 502, 631, [673], 912, 944.

## 7. There is an explained misprint or mistake in the original catalogue.

Nos. [53], 34′·6 correct; 55, [59], there is a 9·2 mag. at $7^h\ 57^m\ 3^s\!\cdot\!0$ $-34°.8'\!\cdot\!3$; also a 10 mag. at $7^h\ 57^m\ 5^s\!\cdot\!4$ $-34°.9'\!\cdot\!3$; [70], two stars $\left\{\begin{matrix} 9^h\ 4^m\ 1^s\!\cdot\!4 & -32°.47'\!\cdot\!0 \\ 9^h\ 4^m\ 6^s\!\cdot\!2 & -32°.51'\!\cdot\!3 \end{matrix}\right\}$, $\alpha$ and $\delta$ mixed in C.Z.?; 76 = C.Z. 1987; [111], 207, 220, requires $\alpha + 1^m$; 223, $\delta = 36'$; 226, 289, $\delta\ -37°$; 293 = S 9922; 300, 301, 458, $\delta\ -69°$?; 480 = C.P.D. $-69°$; 590, error in 1880 Catalogue; 488, 592, [608], $\delta\ 3'\!\cdot\!9$; 813 requires $+10^{sec.}$?, if so = $h$ 4988; 846, 942, $\delta\ -66°$.

## 8. Miscellaneous.

Nos. 43, Cape M.O., 1897·2, equinox 1875, $6^h\ 40^m\ 1^s\!\cdot\!41$ $-36°.57'.55''\!\cdot\!4$, p.m. doubtful; 115, 9·5 at $15^h\ 10^m\ 49^s\!\cdot\!2$ $-35°.19'\!\cdot\!7$; 144 is a nebula; 171, about midway between places of *G* and Cor. D.M.; 188, nebula; 225, p.m.; 251, a 9·7, $\alpha = 14^h\ 4^m\ 38^s$; [278], 3 stars in a line; 282, 10 mag. at $17^h\ 5^m\ 24^s$; 633, $\alpha = 11^h\ 52^m\ 38^s$, p.m.?; 787, secs. = 24, p.m.?; 790, p.m.?; 840, $\alpha = 18^h\ 47^m\ 2^s \pm$?; 867 is $19^h\ 42^m\ 48^s \pm$ p.m?.

## II. *bis.*, LIST OF STARS, 9·0 MAGNITUDE OR BRIGHTER, CONTAINED IN THE FIRST TWO PARTS OF THOME'S DURCHMUSTERUNG, AND MISSING ON THE PLATES OF THE C.P.D.

### 1. No star can be seen in the position given.

Nos. 42, 52, 60, 76, 78, 108, 125, 166, 174, 192, 203, 207, 220, 243, 245, 253, 263, 279.

### 2. A star of the 9th magnitude or brighter exists in the position stated. (See also coloured stars, heads 4 or 5.)

Nos. 1, 2, 4, 5, 7, 9, 10, 12, 13, 14, 16, 17, 18, 19, 23, 24, 25, 30, 32, 34, 37, 40, 41, 46, 50, 58, 63, 67, 69, 70, 95, 97, 99, 109, 117, 120, 124, 126, 128, 129, 130, 131, 132, 133, 137, 143, 150, 155, 159, 161, 163, 164, 167, 179, 181, 185, 186, 187, 196, 197, 199, 201, 208, 221, 223, 228, 236, 237, 238, 246, 258, double; 266, 269, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 292, 293, 294, 295, 297, 299, 304, 306.

### 3. A star, fainter than 9th magnitude, exists in the position stated. (See also coloured stars, heads 4 or 5.)

Nos. 3, 6, 8, 11, 15, 21, 22, 26, 27, 28, 29, 33, 35, 36, 38, 39, 43, 44, 45, 47, 49, 50, 53, 56, [57], 59, 61, 62, 64, 65, 66, 68, 72, 73, 74, 75, 77, 80, 81, 82, 86, 87, 88, 89, 90, 91, 92, 93, 94, 98, 101, 102, 103, 104, 105, 106, 107, 110, 111, 112, 113, 115, 116, 118, 119, 122, 123, 127, 134, 135, 136, 139, 140, 141, 142, 144, 146, 147, 148, 149, 151, 152, 153, 154, 156, 157, 158, 160, 162, 165, 168, 169, 170, 171, 173, 175, 178, 180, 182, 183, 184, 188, 189, 190, 191, 193, 194, 195, 198, 200, 202, 204, 205, 206, 209, 210, 211, 212, 213, 214, 215, 217, 218, 222, 224, 225, 229, 230, double; 231, 232, 233, 234, 235, 239, 240, 241, 247, 248, 249, 250, 251, double; 252, 254, 255, 256, 257, 259, 260, 261, 264, 265, 267, 268, 270, 271, 272, 273, double; 274, 275, 276, 277, 278, 280, 291, 296, 298, 300, 301, 302, 303, 305, 307, 308, 309.

Note:—Heads 2 and 3. In general, the scale of magnitudes assumed agrees with that of the Cordoba D.M.

### 4. The star is coloured—yellow to orange.

Nos. [4], [10], 12, 18, 19, 34, 49, 50, 53, 62, 67, 68, 69, 73, [129], 138, 150, 195, 200, 228, [234], 235, 246, 252, 257, 260, 269, 270, [282], 285, 287, [295], 302, 305, 306, 307.

### 5. The star is coloured—orange-red to deep red.

Nos. 1, [5], 6, 13, 15, 21, [22], 31, [32], 33, 35, 36, 46, 50, 58, 61, 66, 70, 72, [74], 75, 77, 81, 82, 86, [88], 92, 99, 112, 116, 120, 124, 128, 136, 137, 147, 151, [154], 155, 159, 161, 163, 164, 165, 167, 173, 178, 181, 182, [183], [184], [188], 197, [199], [201], 205, 210, 221, 223, 232, 233, 236, 237, 238, 241, 248, 267, [278], [281], [294], 297, 300, 308.

# PREFACE.

With this third volume the work proper of the Photographic Durchmusterung may at last be considered complete.

The work has cost nearly double the time—six or seven years—which I originally estimated would be required. The difference is explained as follows:—

1st. The number of stars actually entered in the C.P.D. is more than double that which was at first expected, the original estimate having been based on the supposition of equal star-density with that of the Northern Bonner Durchmusterung.

2nd. The slender resources at my disposal did not allow the employment of more than two or, sometimes, three clerks. Of these only *de Vries* has been with me from beginning to end, and it is largely to his untiring zeal and devotion that the ultimate success of the work is due. The others left me, generally after a very short time, for more remunerative posts. It must be evident that this frequent change of assistants, all of whom were at first absolutely inexperienced in work of the kind, was most detrimental to the rapidity, if not to the quality, of the work.

No one can regret this long delay more than myself. My only consolation is that, however long the delay, the man who originally planned the whole work, but who feared that the measurement and cataloguing must be relegated to his old age, now sees it finished, secure against the uncertainties of all human affairs, at a time of life in which his activity is unabated, so that, if the work proves to be a useful one, he may not only see it bearing fruit, but may himself be enabled to bring some of that fruit to maturity.

The greatest advantage of the photographic method unquestionably is that, by the side of the catalogue, a permanent and authentic record of the state of the sky at a determined epoch is preserved. Every error, every doubt as to the reality, position, or magnitude of a star can be settled at once by an inspection of the plates.

To make the most of this advantage, the original negatives of the C.P.D. will be preserved at Groningen, where the parallactic measuring apparatus will be kept mounted.

All astronomers using the C.P.D. are earnestly requested to communicate any case of doubt or any query that may be solved by our plates, in order that the point may be settled by an inspection of the negatives.

Nothing now remains but to thank those who have contributed to the success of the work.

It is with a deep feeling of gratitude, that now, at the end of the work, I look back upon much kind and generous help from so many different quarters, without which help it would have been barely possible to bring the work to a successful issue.

Besides the Government, which, on the recommendation of the curators of our University, has gradually augmented its annual subsidy, financial help was generously given by the *Bataafsch Genootschap der proefondervindelyke wijsbegeerte te Rotterdam* and the *Provinciaal Utrechtsch Genootschap van Kunsten en Wetenschappen.*

By this help the first difficulties of instrumental outfit and assistance in the measurements were in great part overcome; and the approval of the work thus implied contributed in no small degree to encourage me in my labours.

The Observatory of Leyden most kindly lent all books necessary for the work which were not in our own University-library, as, unfortunately, is the case for the greater part of them. I feel deeply indebted to Professor H. G. van de Sande Bakhuyzen and to his brother, not only for this act of kindness, but for the unceasing interest with which they have honoured my work from beginning to end.

Last, and not least, I am happy to acknowledge my deepest obligations to my friend and colleague, Professor Huizinga, who, at the beginning of the work, when practical astronomy was absolutely houseless at Groningen, graciously, and at no small inconvenience to himself, offered me the use of two rooms in his laboratory.

In these two rooms the whole of the measurements, and by far the greater part of the computations, have been made, so that, strange as it may sound, the Cape Photographic Durchmusterung, as far as the catalogue is concerned, may be said to have emanated from the Physiological Laboratory of Groningen.

# INTRODUCTION.

## 1. *Preliminary remarks.*

In order to save further delay in the publication of this third and final volume of the Cape Photographic Durchmusterung, it seems advisable to restrict this introduction within more narrow limits than were originally intended.

The hope expressed in the Introduction to vol. i., that in the present volume we would have been able to give :—

*a.* A list of errors for the catalogues compared with the C.P.D.;
*b.* A list of large, and as yet unknown, proper motions;
*c.* A list of new variables;
*d.* An investigation of the systematic corrections for the magnitudes of every individual plate;
*e.* A further investigation on the colour of the stars in the Milky Way;

has been given up for the present therefore. All these matters (except that under *d*, which has not been begun as yet) are under investigation here or at the Cape, and still require some considerable time for their completion.

It seems especially undesirable to wait for their completion, as this volume covers a part of the sky for which no complete survey exists up to the present date.

## 2. *On the measuring apparatus.*

The measuring apparatus described in vol. i. has been used throughout for the *whole* of our Durchmusterung.

The description, however, as there given, applies fully only to the instrument as it was after some changes made in the summer of 1887. For the measurements made before this time (the Zones $77\frac{1}{2}$ to Pole) the instrument was less efficient in several points.

The most important changes then made were the following :—

*a.* A new graduation of the hour-circle.
*b.* The introduction of a new and wider diaphragm in the ocular, in order to enlarge the field to somewhat over a degree.
*c.* The introduction of a second plate-holder.

The hour-circle used for our instrument is one borrowed from an old and defective universal instrument belonging to the astronomical collection of the University. It was originally divided from 5′ to 5′.

As this interval corresponds to $20^{sec.}$ in time, it was not difficult to get the readings expressed in time.

For this purpose every third line (corresponding to a whole minute in time) was somewhat prolonged, and every sixth line, that is, every second minute of time, was numbered. By estimating tenths of the intervals we thus got readings accurate to *two* seconds of time, and *adding* the seconds obtained for the R.A. of any star in the *two* measurements of the plate (instead of taking the mean), the mean reading was obtained at once in seconds of time.

The accuracy thus obtainable may be considered amply sufficient for stars near the Pole, but it certainly seems somewhat rough for other parts of the sky. Moreover, it will be understood that the numbers, scratched with a needle in the silver of the circle, looked rather bad, as seen under the microscope.

These reasons determined me to avail myself of the opportunity given, by an unavoidable interruption of the measurements, to send the circle to Messrs. Wanschaff in Berlin, who redivided it from $10^{sec.}$ to $10^{sec.}$, with every whole minute numbered, in a way which seems to leave nothing to be desired.

The diaphragm in the ocular, used for the observation of the polar plates (declin. $77\frac{1}{2}$ to Pole) gave a field of about 40′ on the plates. The plates were measured in zones 30′ in breadth, so that two adjacent zones had a strip in common of about 10′.

This was felt to be a serious inconvenience, especially as it involved the rearrangement of the observations, which in the catalogue were to be given in zones covering a whole degree of declination.

I very soon convinced myself that the qualities of the objective would perfectly allow the measurement of a field of somewhat over a degree in width.

Accordingly, another diaphragm was provided, which was fitted with a new and very excellent photographic ocular-scale covering a range of somewhat over 65′ in declination.

About the advantages of the introduction of a second plate-holder, and the manner of its uses, see Introduction to vol. i. p. (10).

At the same time some minor improvements were made in the instrument itself, in the methods for orientation and illumination of the plates, which need not be detailed here, as the instrument and its accessories have since remained materially unaltered, and have been described at length in the Introduction to vol. i.

When the measurements were resumed in November, we have, of course, regularly measured zones of one degree in breadth. An exception was only made for those cases where the limits of the plate compelled the measurement of "half" zones. For the belts

Digitized by Google

of plates having their centre at declinations 85°, 80°, 75°, 70°, 65°, these limits lie at 87°.5, 82°.5, 77°.5, 72°.5, 67°.5, 62°.5.

To avoid the trouble caused by these "half" zones, Dr. Gill had the kindness to arrange the centres of the further belts of plates at the half degrees (55½, 50½) instead of at the whole degrees.

The greater ease in the reductions and in the arrangement of the catalogue—caused partly by the modification of the instrument, partly by modifications introduced in the ledgers and the arrangement of the observations—have been such that I have often since regretted that I did not at once resolve to reobserve the whole of the polar cap. I am quite sure that considerable time would have been *saved* by such a course.

3. *On the reductions of the right ascensions and declinations.*

For all the stars from declination −18° to declination −58°.0, that is, for all stars of vol. i., vol. ii., and part of those of vol. iii., the reductions of the right ascensions and declinations have been made in strict adherence to the rules given on page (19) of the Introduction to vol. i.

For the stars between declination −58°.0 and the Pole these reductions were made to depend on a far smaller number of known stars. On the other hand, the five zones measured on every plate were not generally treated quite independently—at least for the right ascensions—but the corrections applied to the measured values of this co-ordinate were made to vary continuously over the whole plate.

This mode of reduction was abandoned after the completion of the belt of plates −60°, as it appeared that a separate and independent reduction of every zone based, not on a few, but on *all* the stars of Gould's Catalogues, gave somewhat better results, without materially increasing the work of reduction.

I have thought it worth while to revise the whole of the reductions of the stars between −58°.0 and the Pole in accordance with the plan followed for the remaining part of the sky, and to apply supplementary corrections, wherever these seemed clearly called for. These supplementary corrections are, without exception, very small; still there can be no doubt that the accuracy has in this way been materially increased. As will appear in considering the probable errors, the right ascensions seem now quite satisfactory. That the declinations are somewhat less so, at least as compared with the declinations of stars north of −58°.0, is in great part owing to the fact that, the declinations having been rounded off at 0′·1, the sum of two partial corrections led necessarily to somewhat less accurate values than a single correction.

Besides this, there are other reasons why the measurement of the circumpolar region is slightly inferior in point of accuracy, the chief of which is the greater influence of small instrumental errors in the measurement of plates which have a very wide range in right ascension.

### 4. *On the reduction of the magnitudes.*

Gould's *Zone Catalogue*, on which our reductions of magnitude for the stars south of −24° have been made to depend (see vol. i. Introd., p. (19)), gives hardly any star south of −80°. For the Zones −80° to the Pole, recourse was therefore had to the *Cordoba General Catalogue*, which, having been made by the same observers, nearly at the same time, may be considered homogeneous with the *Zone Catalogue.* The number of stars in the *General Catalogue,* however, being so much smaller, the method of reduction of the magnitudes explained in the Introduction to vol. i. becomes insufficient. For this reason all the plates of the belt −85° and the polar plate itself were carefully compared with the surrounding ones. As the overlap for these plates is, without exception, very considerable, this comparison led to an adjustment of the plates *inter se,* by which the trustworthiness of the reductions was greatly strengthened. For a great number of the plates in the belts of plates −65° and −75°, a similar adjustment, although not strictly necessary, has been made. This fact has been noted in the list of plates by the word "adjusted" in the column for *n*.

For all the rest of the plates, the reductions of the magnitudes have been made in accordance with what has been said at p. (19) and p. (20) of the Introduction to vol. i.

### 5. *The polar plate.*

Nearly at the very beginning of the work the polar plate was measured and reduced in the usual way. Both in the measurement and in the reduction some difficulty was encountered, because in measurement the construction of the instrument does not allow a complete rotation about the hour-axis, and in reduction there is a lack of suitably situated known Standard Stars.

Gilliss's Catalogue of circumpolar stars had not then been published, and in Gould's Catalogue many blanks occur—for example, there are no stars in Zone −87° between $23^h\ 27^m$ and $12^h\ 7^m$.

To obviate this difficulty, a series of stars was observed in the meridian at the Cape, which will be found in the *Cape Annual Catalogue* for 1891, and which have been referred to in the C.P.D.

Before these were used, however, for a re-reduction, the idea occurred to me to make use of Repsold's apparatus, acquired, in the meanwhile, by the Astronomical Laboratory, and to measure *accurately* the rectangular co-ordinates of all the stars on the polar plate. I adopted this course because I had long wished to obtain in some way or other the materials for getting a fair idea as to the accuracy of the positions it would be possible to arrive at with such plates as were used for the C.P.D.

It is very probable that, even in a not very remote future, questions about proper motion of stars not contained in other catalogues of an anterior date, with the exception

Digitized by Google

of the C.P.D., may be settled at once by some measurements on our plates. For such questions it is important to know, at least approximately, what is the accuracy obtainable from these plates.

It is true that, with regard to rapidity of reduction, another plate, nearer to the equator, would have had advantages over the polar one; but on the other hand, it seemed to me that if the positions of the stars around the Pole could be obtained with an accuracy of the order of that of Gould's *Zone Catalogue*, they would be specially welcome to the astronomer, as in some sort a supplement to Gould's admirable work. The work once decided upon was executed in part by the two clerks, de Vries and Roose; and in part by Miss Reitsma, who, for a short time, volunteered to take part in the work of the laboratory.

Nearly everything visible up to quite near the edge of the plate has been measured. Indeed, as may be seen in the catalogue, there have been measured a few stars of declination as low as 86°.0′. It seems probable that the position of these latter stars will be somewhat systematically in error, owing to their deformation. For the remaining stars some slight systematic error is also probable, because the reductions have not been made with the utmost refinement. Notwithstanding this, as will be shown below, the probable errors of our declinations are even somewhat smaller than those of Gould's *Zone Catalogue*; whereas, as was to be expected, our right ascensions are of the same order of accuracy as our declinations.

All the magnitudes, as well as the positions of a few faint stars which were overlooked in measuring the rectangular co-ordinates, were taken from the measurement made with the ordinary apparatus. For the latter stars the right ascensions and declinations are set down accurate to $1^s$ and 0′·1 respectively (as for the other circumpolar plates), whereas the positions derived from rectangular co-ordinates are given to $0^s{\cdot}1$ and 0′·001. The two sets of stars are therefore readily distinguishable.

### 6. *The precessions.*

The amount of precession for twenty-five years (secular variation and higher terms neglected) was given in vol. ii. in exactly the same way as in vol. i.—*viz.*, at the bottom of every column. Even for the Zone −52°, the highest in declination of this volume, the difference of the values for consecutive columns is so small that it may either be wholly neglected, or taken into account by a most simple interpolation. Everywhere a precession of about $1^{sec.}$ in R.A., and 0′·1 or 0′·2 declination, is thus readily obtainable.

It is evident, however, that the higher the declination and the greater the range in R.A. in a single column, the more unsatisfactory this mode of getting the precession must become.

I have therefore adopted another plan in the third volume. The precessions at the

Digitized by Google

bottom of the columns are omitted, and instead, small tables are given on the margin of each page.

(*a*) For the Zones 53°, 54° . . . . 69° these tables contain, *for the middle declination of the zone* and for every tenth minute of R.A., the precession (for twenty-five years) both in R.A. and declination.

Still nearer the Pole the influence of a deviation of the declination from that of the middle of the zone, which may, of course, amount to 30′ in the extreme, begins to make itself felt. Therefore—

(*b*) For the Zones 70°, 71° . . . . 85° the tables give the precession in R.A. in the form

$$a + bd,$$

where $d$ = number of minutes of the declination.

The numbers $a$ and $b$ were determined in such a way that the values inserted in the tables represent the precession *rigorously* for the declinations 15′ and 45′ of any zone.

At declination 86° even this device begins to fail. Moreover, for 86°.0′ the effect of the secular variation in twenty-five years amounts already in extreme cases to $9^s\cdot3$ (= $9''\cdot7$ arc of *g.c.*) in R.A. and $10''\cdot1$ in declination, and nearer to the pole the effect of this term and of that of the higher terms in the precession increases with extreme rapidity.

A satisfactory continuation of the system of tabulating the precession would, for these reasons, lead to very great complication, especially if an accuracy is sought somewhat in proportion to the greater precision with which the polar plate has been measured.

As the total number of stars south of −86° amounts only to 1050, the simplest and most effective plan is to give the necessary data for the computation of the precession for every individual star, and this plan was therefore definitively adopted. In order to conform as closely as possible to the plan followed in the rest of the catalogue, I have exhibited these data in a manner somewhat different from that usually adopted :—(*a*) the positions are given for the equinoxes 1850 and 1900 ; (*b*) the annual precessions for 1875 and 1900.

The former were computed from the positions for 1875 using *three* terms of the precession for the Zones 86° and 87°, *four* terms for Zone 88° ; whilst the stars of Zone 89° were trigonometrically brought up to the new epochs.

The accuracy of the computation has been such that I confidently hope that the error in the positions due to errors in the precession will, in general, not amount to more than $0^s\cdot2$ and $0'\cdot002$, and in no case to sensibly more than $0^s\cdot3$ or $0'\cdot003$.

The yearly precessions have been computed either with the definitive positions, or with positions differing so little from these that no error on this score need be feared.

Digitized by Google

All the computations have been thoroughly checked. The data (*a*) and (*b*) furnish everything that is wanted for bringing the positions of our catalogue up to any required epoch. If only rough positions are wanted, it will generally be sufficient (at least for the Zones 86, 87, 88) to interpolate or extrapolate the precession for the middle between the epoch required and the epoch 1875. The positions thus derived are, of course, correct to the second term of the precession (sec. var.) inclusive. It is, however, easy to push the accuracy to terms of the third or fourth order. Let $t$ be the number of years counted from 1875, $T = \frac{t}{25}$; then we have, *accurate to the third term of precession* (*inclusive*) :—

$$\alpha t = \alpha 75 + \tfrac{1}{4}T[T(2T-3)(\alpha 1900 - \alpha 50) + 100(1+T-T^2) \times \text{pr.}\,75 + 50T \times \text{pr.}\,1900].$$

In the same way, *accurate to the fourth term of the precession* (*inclusive*) :—

$$\alpha t = \alpha 75 + \tfrac{1}{4}T[T(1+T)(7-5T)(\alpha 1900 - \alpha 75) - T(1-T)^2(\alpha 75 - \alpha 50) + 100(1-T)(1-T^2) \times \text{pr.}\,75 - 50T(1-T^2) \times \text{pr.}\,1900].$$

For the declinations change $\alpha$ into $\delta$.

The latter formula gives for the epochs 1880, 1885 . . . .

| | | | | | |
|---|---|---|---|---|---|
| $\alpha 1880$ | $= \alpha 75 + 0.08[$ | $+\ 0.90(\alpha 1900 - \alpha 75)$ | $-0.08(\alpha 75 - \alpha 50)$ | $+\ 48.0$ pr. 75 | $-\ 6.0$ pr. 1900] |
| $\alpha 1885$ | $= \alpha 75 + 0.16[$ | $+\ 1.75$ | $-0.09$ | $+\ 31.5$ | $-\ 10.5$ ] |

| $\alpha 1910$ | $= \alpha 75 + 0.56[$ | $0.00$ | $-0.14$ | $+\ 24.0$ | $+\ 42.0$ ] |
| $\alpha 1915$ | $= \alpha 75 + 0.64[$ | $-\ 2.60$ | $-0.36$ | $+\ 58.5$ | $+\ 78.0$ ] |
| $\alpha 1920$ | $= \alpha 75 + 0.72[$ | $-\ 6.30$ | $-0.72$ | $+112.0$ | $+126.0$ ] |
| $\alpha 1925$ | $= \alpha 75 + 0.80[$ | $-11.25$ | $-1.25$ | $+187.5$ | $+187.5$ ] |
| | $= \alpha 50 -$ | $9(\alpha 1900 - \alpha 75) + 150(\text{pr.}\,75 + \text{pr.}\,1900)$. | | | |

For the declinations, change $\alpha$ into $\delta$.

Using Crelle's *Rechentafeln*, the computation thus becomes very easy.

For the stars of Zone $-89°$, the computation of a position for a somewhat remote epoch still remains troublesome and inaccurate. I have therefore thought it worth while to compute (trigonometrically) for these stars the position for every tenth year from 1900–1950. Fabricius' method was found very convenient for these computations. For intermediate epochs the position can be found by interpolation. The accuracy of resp. $0^m.1$ and $0'.01$ still corresponds closely enough to that of the measurements on which the positions rest.

7. *Systematic errors of the magnitudes depending on the position of the stars on the plates.*

As Dr. Gill states in his Introduction to vol. i. p. xix, "the whole of the plates definitively used for the catalogue were taken with the shorter focus, Dallmeyer lens, either in its original or repolished condition."

Digitized by Google

The following data will suffice to distinguish the plates obtained with the lens in the two conditions.

Of the plates used for the C.P.D. were obtained :—

I. *With lens in original condition* : all the plates between the declination $-58°.0'$ and the South Pole, *with the exception only of the repeated plates.*

II. *With the repolished lens* : all the plates north of $-58°.0'$.

The repeated plates between $-58°.0'$ and the Pole, all taken with the repolished lens, are the following :—

| ° | h m | ° | h m | ° | h m | ° | h m | ° | h m |
|---|---|---|---|---|---|---|---|---|---|

| | | | 20 0 (581) | | 18 0 (553) | | | | 18 36 (484) |
| | | | 21 0 (582) | | 19 30 (555) | | | | |
| | | | | | 22 30 (559) | | | | |

All the Plates I. were taken before or on the night of 14th November 1886.

All the Plates II. were taken after or on the night of 3rd May 1888.

In the Introduction to vol. i. art. 8, the conclusion was reached that a systematic error of the magnitudes depending on the position of the stars on the plate, does not exist to any appreciable amount for the plates discussed in that volume. This conclusion, which was deduced partly from a consideration of the stars of vol. ii., may be safely extended to all the stars of the C.P.D. north of $-58°.0'$—that is, to the whole of vol. ii. and part of vol. iii., and besides to the repeated plates nearer the South Pole enumerated above.

On the plates taken with the lens in its *original* condition, the images of the brighter stars near the edges of the plates are somewhat irregular. For these plates, therefore, the conclusion formerly arrived at cannot evidently be accepted without a separate investigation. I have therefore extended the discussions of vol. i. to these plates.

*a.* Countings made of the stars contained in the different zones of declination give the following results :—

Only the first zone seems slightly deficient in stars.

*b.* Again, for a more detailed comparison of the several parts, the plates were divided into *nine* divisions, as follows :—

where $\alpha$ and $\delta$ are the co-ordinates of the centre; T the extent of the plate in the direction of R.A. to within $1^{\text{min.}}$ of the nominal limit.

The *two* following groups of *rich* plates were considered :—

1st Group: Nos. 473, 475, 476, 477, 478, 513, 514, with, in all, 10,574 stars.
2nd Group: Nos. 515, 516, 517, 541, 542, 543, 573, 574, 575, with a total number of 5891 stars.

Those of the first group are fairly symmetrically situated with regard to the Milky Way; in the second group this condition is not fulfilled (mean galactic latitude = −11°), but this seems not very important, as the greatest differences found are in the direction parallel, and not in that at right angles, to the Galaxy.

The results found in the two cases are as follows :—

The evidence of a systematic difference is here somewhat stronger. Still the systematic errors of the *magnitudes* implied by these numbers are only small, as appears if we convert them into magnitudes by means of the formula :

Number of stars of mag. m or brighter = const. × $3{\cdot}8685^m$ (*Uran. Arg.*, p. 354).

We thus obtain from the three last columns of the preceding table :—

TABLE 4.

Systematic Error expressed in Magnitudes.

| III. | − $0{\cdot}12^5$ | − 0·11 | − 0·04 |

*c*. For the belt of plates −65° the stars photographically between mag. 8·0 and 9·0 have been compared with the magnitudes in Gould's *Zone Catalogue*. This comparison furnished the following table, which may be considered to obtain for stars visually about $8{\cdot}7^m$. All the numbers have been diminished by $0{\cdot}09^m$ in order to reduce the mean to zero. The total number of stars used amounts to 1093.

*d*. For still brighter stars the following data proved available. The number of stars being very limited, no more detailed comparison than that of the Strips I. II. III. could be made. The results obtained are given in the following table, which needs hardly any explanation. By the numbers of the first line, for instance, is expressed the fact that in Division I. of Plate 467 *four* bright stars were found, of which the mean photographic magnitude is 7·05, the mean visual magnitude 7·12 ; *eight* stars in the Division II. where these numbers are respectively 7·49 and 7·77 ; *five* in Division III. giving 7·06 and 7·64 for the same quantities. The three last columns have been formed by subtracting the numbers contained in the preceding ones.

from which it would seem that, whereas the Divisions II. and III. are sensibly homogeneous, the photographic magnitudes in Division I. are about $0{\cdot}2^{m}$ too faint.

Summarizing now the results embodied in the Tables 1, 4, 5, 6, we find that in the direction of the increasing declinations (Strips A., B., C.), the star-density and, corresponding therewith, the difference between the photographic and visual magnitudes, hardly varies to any appreciable amount; that in the direction of the increasing right ascensions (Strips I., II., III.), there appears a small variation of this sort which, however, seems to be in opposite directions for the stars brighter than $9{\cdot}0^{m}$, and those fainter than that magnitude.

Though such a result would not seem to be inexplicable, there still seems reason to doubt its reality—1st, because of the small amount of about $0{\cdot}18^{m}$ in both cases; 2nd, on account of the at least partly, relatively imperfect data from which the results had to be derived. I therefore think that we cannot be far wrong in affirming that *for the plates taken with the lens in its original condition, as well as for those taken with the repolished lens, the systematic errors of the magnitudes depending on the position of the stars on the plates must be all but insignificant.*

8. *Comparison of the photographic and the visual magnitudes.*

In continuation of what has been done for vol. i., in the Introduction to that volume, arts. 9 and 10, I have derived the values of $\Delta p$, $\Delta v$ for vols. ii. and iii., restricting, however, the comparisons to Gould's *Zone Catalogue*.

Digitized by Google

Even for the very bright stars I have (contrary to what was done in vol. i.) used the estimates of the Z.C. in preference to those of the U.A., in order that future studies about the Purkinje phenomenon (Comp. art. 19 of Introd. to vol. i.) may be facilitated and become more conclusive.*

The results are as follows:—

* I have been reproached for over-anxiety to attribute the regular progression in the values of $\Delta p - \Delta v$ and $r$ (Introduction, vol. i. arts. 11, 19) to the exclusive action of Purkinje's phenomenon. Notwithstanding Scheiner's experiment (*Astr. Nachr.*, No. 3505), I am still convinced that the actual state of our knowledge does not yet permit any more positive statement to be made upon the subject than this—*viz.*, that part, at least, of the progression in the values of $\Delta p - \Delta v$ must be due to the phenomenon in question. In the Introduction to vol. i. we did *not* find a decrease in the values of $r$ and $\Delta p - \Delta v$ for stars from mag. 6·0 to 7·0 taken from the U.A. But the magnitudes of these stars were observed either with the naked eye or with an opera-glass only, and therefore, in any discussion of magnitudes as affected by Purkinje's phenomenon, such stars are to be regarded as faint objects. From the fact that for these stars no decrease in the values of $r$ and $\Delta p - \Delta v$ occurs, we must be careful in arriving at definitive conclusions before more exhaustive investigations have been made.

The agreement of Table 9 with the former Table 19 of vol. i. is very remarkable. The greater negative value found in vol i. for the stars 9·0–9·4 Z.C. is readily explained by reasoning similar with that of vol. i. p. (39) in connection with these two facts:—1st, that the Zones $-26\frac{1}{2}$, $-31\frac{1}{2}$, $-35\frac{1}{2}$ contain regions nearer to the Pole of the Milky Way; 2nd, that the plates for these zones are somewhat poorer than those of equal galactic latitude for vols. ii. and iii.

For the last table also the agreement with Table 22 (decl. $-24°.0'$ to $38°.0'$) of vol. i. is generally very satisfactory, and there seems to be no ground for not combining both tables to final values. Giving double weight to the table now derived, we get the following table for the reduction of *the whole of the C.P.D. south of declination* $-24°.0'$ to magnitudes complying with Definition III. of photographic magnitude as given in the Introduction to vol. i. p. (47), and which must replace the second part of the table given on p. (97) of that Introduction.

9. *The probable errors of the right ascensions, declinations, and magnitudes.*

For derivation of the probable errors in right ascension and declination of our positions as contained in vol. ii. and vol. iii., the C.P.D. places were compared with those of Gould's *General Catalogue.* The P.E. of the *differences* were found to be as follows :—

P.E. of G.—C.P.D.

| Belt of Plates. | P.E. in $\alpha$. | P.E. in $\delta$. | Number of Stars. |
|---|---|---|---|
| | s | ′ | |
| 40½ | 0·289 | 0·0474 | 102 |

| 80 | 0·820 | 0·0502 | 40 |
| 85 | 1·023 | 0·0473 | 32 |

In the last column have been given the numbers of stars from which the several results were derived.

If, now, we assume that the P.E. of Gould's positions due to the combined effect of proper motion and accidental error of observation are :—

| Declinations. | P.E. in $\alpha$. | P.E. in $\delta$. |
|---|---|---|
| −38° to −58° | ±0s·09 | } ±0′·0133 |
| −58 „ −86 | ±0s·0467 sec $\delta$ (=0″·7) | |

get for the P.E. of the positions in the C.P.D. respectively :—

| Declinations. | $r\alpha$. | $r\delta$. |
|---|---|---|
| −38° to −58° | $\pm 0^{s}{\cdot}288$ | $\pm 0'{\cdot}0444$ |
| −58° „ −86° | $\pm (0^{s}{\cdot}157 + 0^{s}{\cdot}0764 \sec. \delta)$ | $\pm 0'{\cdot}0559$ |

For the polar plate *all* the stars common to the C.P.D. and G were used, with the exception only of G 24354, for which the deviation in the declination is somewhat large, but which is very faint, and depends only on a single observation in Cordoba.

For the combined effect of proper motion and error of observation in Cordoba were here adopted the somewhat smaller probable errors :—in R.A. $\pm 0''{\cdot}4$ (arc of gr. circle), and in declination $\pm 0''{\cdot}5$, by the aid of which we get for the probable error of the C.P.D. positions,

in R.A. $\pm 0''{\cdot}53$ (arc of gr. circle), in declination $\pm 0''{\cdot}76$.

These values, compared with the P.E. of Gould's *Zone Catalogue* for the declinations −45° to −80°—*viz.*, in R.A. $\pm 0''{\cdot}66$ (arc of gr. circle), in declination $\pm 0''{\cdot}80$—show that for the polar cap our positions are in no wise inferior to those of Gould's zones, and may therefore be regarded in some sort as a supplement of that work.

The probable errors found for vol. i. (Introd., pp. (51) and (53)) were

$\pm\ 0^{s}{\cdot}269$ and $\pm\ 0'{\cdot}0435$.

They do not materially differ from those found for the stars between declinations −38° and −58°. We may thus condense all our results into the following summary :—

| Declinations. | P.E. in R.A. | P.E. in Declination. |
|---|---|---|
| −18° to −58° | $\pm\ 0^{s}{\cdot}28$ | $\pm 0'{\cdot}044$ |
| −58° „ −86° | $\pm (0^{s}{\cdot}157 + 0^{s}{\cdot}0764 \sec. \delta)$ | $\pm 0'{\cdot}056$ |
| Polar plate. | $\pm\ 0^{s}{\cdot}0353 \sec. \delta$ | $\pm 0'{\cdot}0127$ |

In seconds of arc of the great circle we have therefore the following table :—

TABLE 12.

The cause of the decrease in accuracy of the declinations south of $-58°.0'$ has been explained in art. 3.

As to the probable errors of the magnitudes, the results derived in the Introduction to vol. i. p. (55) will, doubtless, hold for all plates obtained with the repolished lens.

To obtain also data for the plates taken with the lens in its original condition, a great number of comparisons have been made between the estimates for the same stars, made by the two observers at the ocular of the measuring apparatus. The resulting probable errors are strictly comparable with the values $\tau$ given in vol. i. p. (55). They are as follows:—

TABLE 13.

P.E. of Mean of Two Observations. $\tau$.

| Limits of Diameter. | Mean Diameter. | Mean Magnitude. | P.E. of Diameter. | P.E. in Magnitude. | Number of Stars. |
|---|---|---|---|---|---|
| ′ ′ | ′ | | ′ | m | |
| <0·2 | 0·07 | (9·0) | ±0·0125 | ±0·048 | 455 |
| 0·2 to 0·5 | 0·34 | (8·6) | 0·0215 | 0·069 | 426 |
| 0·5 „ 1·0 | 0·7 | (7·5) | 0·038 | 0·093 | 272 |
| 1·0 „ 2·0 | 1·4 | (6·6) | (0·096) | (0·144) | 16 |

If the four results are combined with weights proportional to the number of stars of each class of magnitude, we obtain

$$\tau = \pm 0{\cdot}055^{m},$$

which is sensibly *smaller* than that found for the same quantity in vol. i. It increases, however, much more rapidly with the brightness than is the case with the plates obtained by the repolished lens. If we consider that the images of the stars produced by the lens in its original state are, on the whole, considerably larger, and that, at the same time, the images of brighter stars are more irregular in outline towards the edges of the plates, this result is exactly what might have been anticipated.

It may be well to make a general remark here concerning the *very* bright and the *very* faint stars contained in the catalogue.

As far as I know, no formula has yet been given for converting diameters into magnitudes, which will allow of an extrapolation considerably beyond the limits of magnitude of those stars on which the determination of the constants of the formula depend. The formula used for the C.P.D. (see Introd. to vol. i. p. (20))—though I know as yet no better one—is not exempt from this rule. The consequence is that, speaking roughly, for the stars brighter than 6·5 or fainter than 9·5, the magnitudes as given in the catalogue are far less reliable than those for stars within these limits.

Digitized by Google

The uncertainty rapidly increases as we recede from these values, and such magnitudes as, for instance, $5{\cdot}0^m$ or brighter, and $10{\cdot}5^m$ or fainter, will be certainly illusory in most cases.*

The fact that, in deriving our magnitudes, we have adhered throughout to one and the same very simple formula, will make it easy, however, to derive corrections as soon as a better formula is known, or to fall back on the quantities really measured—*i.e.*, on the diameters of the stars on the plates.

10. *On the limit of magnitude to which the C.P.D. may be considered complete.*

It may be safely laid down as a rule, that, if from the magnitudes, as given in the catalogue for the faintest stars on any one plate, we subtract $0{\cdot}3^m$, we will obtain the limit of photographic magnitude to which the stars of the catalogue are certainly practically complete.

In those cases where the images on the measuring plate (as seen in the measuring telescope) are equal to those on the check plate, and *a fortiori* in those cases where the latter were denser,† and this relation has been the almost general rule, this number may even safely be diminished to $0{\cdot}2^m$ or even somewhat less, especially for the poorer plates where every effort was made to get the stars as completely as possible.

It is an advantage of photography that a generally reliable limit of magnitude can thus be at once assigned for every separate region covered by any plate. If this criterion is applied to the *whole* of the plates of the C.P.D., it will be found that we may safely assume the *whole catalogue* to be complete to stars of the photographic magnitude 9·2. There is but one exception—*viz.*, the plate No. 246 ($-35\frac{1}{2}$, $20^h\ 37^m\ 54^s$).

For this plate the faintest stars measured are photographically of the magnitude 9·23, and the limit of certain completeness would thus be 9·03. However, considering that the images on the check plate are here sensibly denser than on the measuring plate, and further, that not a single star of Gould's *Zone Catalogue* is missing on the plates, there seems reason to believe that here, also, the limit of magnitude to which the stars have been *completely* observed will not prove materially below 9·2.

Another question, of course, is—To what limit of magnitude would the plates be found complete, were the magnitudes of the C.P.D. reduced to a homogeneous set of photographic magnitudes for the whole sky? All things considered, I confidently believe that the C.P.D. will be found practically complete, in or near the Milky Way, to stars which, in the scales of Gould, Schönfeld, and Thome, are of the magnitude 9·5, and for the rest of the sky to stars actinically equivalent to these. The reason why this cannot be put into a simpler form lies, of course, in the systematic differences between photographic and visual magnitudes, depending on the galactic latitude (see Introd., vol. i. art. 7). Whether these discrepancies are caused by errors of the visual estimates, or by the difference between the colours of stars in different galactic latitudes, is here, of course, irrelevant.

* The disagreement of the formula and the observations must not be wholly ascribed to the form of the formula. It is certainly also due, to a great extent, to the want of rationality in Gould's scale, especially near the lower limit of his magnitudes. Where the range of magnitude on the plate is small, the determination of the constants B and C must have been largely influenced thereby.

† An estimate of the relative density of the images of the faint stars on measuring and check plate is given in the list of plates.

Total number of stars in C.P.D., 454,875.

This number is considerably *greater* than the number of stars (431,760) contained in the similar works of Argelander and Schönfeld for the rest of the sky (−19°.0′ to North Pole), and but little less than the *total* number of stars (457,857) given by these authorities for the whole of the sky from −23°.0′ to the North Pole.

Subtracting the stars of Zone −18°, we get for the total number between −19° and the South Pole, 454,384 stars on a total area of 13,911·15 square degrees; so that we have in the mean

32·66 stars per square degree, as against

## 12. *Chronology of the measurements.*

The following summary will show at a glance the time that has been expended on the measurement of the various parts of the C.P.D. A fair idea of what can be done with good plates, if the work can be prosecuted without serious interruption, is given by the period 1890 October 7 to 1892 June 11. In these twenty months the whole work of measuring from declination $-34°.0'$ to declination $-58°.0'$, with a total of nearly 250,000 stars, was executed. This number of stars represents considerably more than half of the whole of the stars contained in the C.P.D.

The first photograph for this region was taken on 27th November 1889.* The time elapsed from the beginning of the photographing till the end of the measuring amounts, therefore, to but slightly more than two years and a half.

The table contains also the names of the persons by whom the first observation at the ocular of the measuring apparatus has been made† (the second one and all the revisions have been invariably made by myself), and of those by whom the hour-circle was read.

| Dates. | Plates Measured. | 1st Measurement made by | Hour-Circle read by | Remarks. |
|---|---|---|---|---|
| 1886 Oct. 28 | Polar plate. | $K_1$ | $N_1$ | Hour-circle in its original condition; diameter of field of telescope only 40′ (see art. 2). Polar plate was afterwards remeasured in rectangular co-ordinates (art. 5). |
| to | Belt 85° complete. | $K_1$ | $N_1$, a few by $N_2$ | |
| 1887 June 9 | „ 80° „ | $K_1$ | $N_1$, a few by $N_2$ | |
| | | | | Between 1887 June and November the hour-circle was re-graduated, and a new diaphragm giving a field of 65′ was inserted in the telescope (see art. 2). |

| to | „ 48 „ complete. | S | R | Only *once* measured. |
| 1890 June 7 | „ 40 „ 17 10 −23 50 | S | R | |
| | „ 31½ 23 48 − 9 24 | S, V | R | $6^h\ 36^m$–$9^h\ 36^m$, 1st measuring by S, rest by V. |
| | „ 26½ 23 49 −14 26 | V | R, $K_2$ | $K_2$, $23^h\ 49^m$–$4^h\ 19^m$ and $7^h\ 19^m$–$11^h\ 4^m$, rest by R. |
| | „ „ 17 26 −21 11 | V | R | |
| | „ 21½ 23 50 −11 50 | V | R | From $11^h\ 10^m$–$11^h\ 50^m$ only once measured on original plates. These were so bad that they were rejected before a second measurement was made. |

* The last plate was taken 31st January 1891. The taking of the photographs of this region, therefore, took only fourteen months.

† This name has also been given for every plate definitively retained for the C.P.D. in the list of the plates.

## 13. *References to other catalogues and list of abbreviations.*

In general the rules given in art. 20 of the Introduction to vol. i. have been adhered to throughout the whole of the work. Advantage only was often taken in the third volume of those cases in which space allowed of a reference to *more* than five authorities. In these cases the five authorities which have precedence are duly given, together with some additional ones, mostly of a relatively remote epoch.

We may, perhaps, be allowed expressly to draw attention to the fact that in order to get the utmost benefit from these references, our catalogue must be used in connection with that of Stone. Except for the stars nearest the equator, which have been frequently observed at many of the northern observatories, the two catalogues together will in most cases give reference to nearly every authority of real importance for the derivation of proper motion up to about 1880. For positions observed in or before 1850, the type used for the reference to Stone shows at once whether or not we may hope to find further authorities in the *Cape Catalogue* for 1880.

To the catalogues referred to in vols. i. and ii. there has been added for the third volume :—

Gilliss's Catalogue of circumpolar stars, which recently appeared in the *Washington Observations* for 1890, Appendix I.

There can be no doubt but that this catalogue will render good service for the derivation of the proper motions of the fainter stars in high southern declinations, and I have therefore treated it with particular care. The references are *complete*, with the exception only of a few bright stars for which the references to other catalogues are particularly numerous.

As was to be expected for a catalogue which contains numerous very faint stars, the number of stars missing on the plates is rather considerable. It is on this account that the list of "stars contained in the Catalogues of Precision but missing on the plates" has become much bulkier for vol. iii. than for the two preceding volumes. An extensive list of errors has been sent to the Cape for further elucidation, together with similar lists for other catalogues.

A few references (as specified below) have also been given to the yearly *Cape Catalogue* for 1891.

For the sake of convenience, we repeat here the abbreviations used for the references, as well as those used for other purposes.

Besides these plates, there is a series of plates for the declinations $-53\frac{1}{2}$ to $-57\frac{1}{2}$ completely measured in duplicate, a list of which has been given in Gill's Introduction to vol. i. pp. xxxii to xxxviii.

---

For the arrangement of the catalogue, too, I may refer to art. 25 of my Introduction to vol. i. The principal changes that have been made in vol. iii. are those caused by the more detailed data given for the precession. For these art. 6 of the present Introduction may be consulted.

* It is probable but not certain that, of the two plates used for the measurement, the former has been taken as measuring plate.

The zone $-62°$ contains stars taken partly from the plates of belt $-60°$, partly from those of belt $-65°$. In order that there may be no doubt as to the plates from which the magnitudes were derived, those obtained from the more southern belt were marked with a dagger (†) in the cases in which the number of the plates is *uneven*, with a double dagger (‡) in those in which it is *even*. At the top of the page the numbers of the plates belonging to both the belts have been given. Owing to these precautions, I believe that any mistake must be impossible. The same arrangement has been made on behalf of the Zones $-67°$, $-72°$, $-77°$, $-82°$, and $-86°$.

In the Zones $-86°$ to $-88°$, in the columns of the declinations for 1850 and 1900, some values are *negative*. It need hardly be said that this supposes (contrary to the rule followed for the rest of the catalogue) the *southern* declinations considered as *positive* quantities. In accordance therewith, the sign of the declination at the top of the column has been dropped.

### 15. *Stars missing on plates or in Thome's Cordoba Durchmusterung.*

Of the following lists the second contains a certain number of stars contained in Catalogues of Precision [mostly in those of Rümker, Taylor, and Gilliss (1963 stars)] missing on the plates, but accidentally overlooked in compiling the lists of these stars.

At the end of it will be found a condensed reference to those stars of Brisbane which are not found in the C.P.D. in the position assigned.

No explanation seems needed for the other lists, as they are arranged perfectly in the same way as the corresponding lists of vols. i. and ii.

| 561 | 39 29 | 66 47·4 | r 169 | 7·0 | | There is a star, 7·2 in declination, 20′·5. Also not found by Stone (see footnote in *Cape Catalogue*, 1880). |
| 562 | 41 36 | 60 10·6 | Z.C. 3238 | 10·0 | | Certainly missing on *m.* Very doubtful traces on *c.* |

| 564 | 45 0 | 62 26·4 | *g* 6509 | 8·0 | | Both this star and *g* 6521 have been identified in Gilliss's Catalogue with Brisbane 2697. The assumption of an error of a wire interval brings, indeed, the position of *g* 6509 to agree with that of *g* 6521. The difference in magnitude, however, is considerable. |

# SUPPLEMENTARY LIST OF STARS CONTAINED IN CATALOGUES OF PRECISION, AND MISSING ON THE PLATES.

| No. | α 1875. | δ 1875. | Catalogue No. | Mag. | Remarks. |
|---|---|---|---|---|---|
| | h m s | ° ′ | | | |
| 1 | 0 19 23 | −48 54·0 | r 14 | 7·0 | |
| 2 | 0 53 50 | 48 37·2 | r 37 | ... | In Stone's Catalogue there is the footnote, "Cannot be found." |
| 3 | 1 51 34 | 52 14·3 | r 79 | 7·0 | In Stone's Catalogue there is the footnote, "No star visible, of the seventh magnitude, near the assigned position." Error in R.A. and star identical with $\chi$ Eridani? Declination, however, differs by about 10″ (having regard to p.m.). |
| 4 | 4 35 5 | 24 52·7 | W 2054 | ... | *One* observation. |
| 5 | 6 28 26 | 19 16·2 | l 12645 | 8½ | The place of the Hist. Cel. containing this position and that of some stars in the neighbourhood has been corrected by Argelander, B.B. vii. p. 205. According to this correction, the star l 12645 is to be omitted from the catalogue. |
| 6 | 6 31 32 | 34 52·1 | g 307 | 7·5 | Two errors and identical with G 8083? |
| 7 | 6 40 3 | 36 53·8 | Z.C. 1923 | 10·0 | Cord. Obs. xvii. p. 540, the declination is corrected to 56′·7. In this declination, however, there is still no star in C.P.D. In Thome's DM. the star is evidently identified with (9·6) $6^h\ 40^m\ 2^s{\cdot}0$ −36° 57′·7, which, however, is more probably identical with C.P.D. −36°, 1045 (9·6) $6^h\ 40^m\ 0^s{\cdot}8$ −36° 58′·1. |
| 8 | 7 29 51 | 44 12·9 | g 527 | 7·0 | (*One* observation). In g the star has been identified with Lac. 2874?, which, in its turn, is identified by Stone and Gould with S 3741, G 9797, and p. 1663. These identifications, however, would imply a double error both in Lac. and in g, as appears from the following observations (reduced to 1875·0):<br>h m s ° ′<br>Lac. 2874 7 30 27 −44.11·2<br>Brisb. 1663 30 53·3 1·3<br>Taylor 3137 30 56·4 1·2<br>Gilliss 527 29 51·2 12·9<br>Stone 3741 30 56·2 1·3<br>G.C. 9797 30 56·2 1·3<br>C.P.D. 30 56·4 1·4 |
| 9 | 7 32 5 | 49 29·6 | g 536 | 8·0 | The identification with Lac. 2905 is erroneous (position for 1875: $7^h\ 33^m\ 9^s$ −49° 29′·0). Moreover, Lac. 2905 itself does not exist in the sky (see Stone's Catalogue). |
| 10 | 7 35 40 | 43 3·9 | g 552 | 7·5 | Error in declination and identical with G 9945? |
| 11 | 8 52 7 | 42 46·5 | t 3912 | 9·0 | Identical with S 4758? For 1880:<br>t 3912 (9) $8^h\ 52^m\ 18^s{\cdot}01$ −42° 47′ 36″·9<br>S 4758 (7) $52^m\ 46^s{\cdot}93$ −42° 47′ 39″·1 |

*Not* included in the list (nor in the supplement) are the stars of the Washington Zones and those of Brisbane (p.) missing on the plates. As has been said already in vol. i. p. (67), I have not attempted to correct the errors of the Washington Zones. The work would have been enormous, and the success exceedingly doubtful. Considering the excessively great number of errors, it is evident, however, that without such a work as a preliminary step, the insertion of the missing stars of the Washington Zones into the foregoing list could not be thought of. The list would have become, at the same time, very bulky and very uninteresting.

Much the same thing holds for Brisbane's Catalogue.

There can be no doubt but that practically in every case where a star of the Paramatta Catalogue is missing in the C.P.D., the fact is due to an error in the former. It may be well, however, to give a separate list of the numbers of those stars which are not to be found in the C.P.D. in the position assigned. In many cases I have given, between brackets, references to known stars, which seem, more or less probably, to be the stars really observed. Those cases in which Brisbane's error could be established with tolerable certainty, were inserted in a list of errors of Brisbane. In these cases, references to *p.* will be found in their proper place in the C.P.D.

## LIST OF THE NOS. OF THOSE STARS OF BRISBANE (*p.*) WHICH ARE NOT TO BE FOUND IN THE C.P.D. IN THE POSITION ASSIGNED.

28, 39, 50, 78, 83, 85, 90, 129, 151, 165, 203, 222, 231, 302, 419, 471, 483, 487, 604, 611, 692, 785, 790, 800 (correction $-10^s$?); 809 (correction $-3^m$?); 821, 829, 834, 886, 890, 909, 917 (correction $+30^s$?); 974, 1062, 1070, 1109 (correction about $+5^s$?); 1115, 1123, 1126, 1135 (correction $-1^m$?); 1141, (correction $-1^m$ and =p. 1134?); 1146 (correction $+30^s$?); 1160, 1171, 1211, 1236, 1239, 1277, 1299 (correction $+2^m$?); 1315 (correction $-1^m$ and =p. 1307?); 1398 (correction $+1^\circ$ in C.P.D.?); 1482, 1531, 1543, 1573 (correction $+30^s$?); 1574 (error in R.A. and =p. 1578?); 1577, 1608, 1610, 1646, 1685, 1696, 1783 (error in R.A. and =p. 1757?); 1790, 1804, 1837, 1845 (error in R.A. and =p. 1849?); 1871 (=p. 1869?); 1895, 2040, 2045 (=p. 2044?); 2050, 2059, 2079, 2111, 2118, 2142, 2191, 2245, 2277 (S assumes error in R.A. of about $27^s$ or $28^s$); 2302 (=p. 2308?); 2316 (error of 5′ in $\delta$ and =p 2317?); 2331, 2365 (error in R.A. and =p. 2368?); 2379, 2383, 2448, 2462, 2467, 2471, 2483, 2502, 2510, (error $+50^s$?); 2517, 2538 (=p. 2530?); 2556 (=p. 2558?); 2559 (=p. 2558?); 2576, 2578, 2618, 2713, 2743 (=p. 2736?); 2774, (=p. 2776?); 2775, 2779, 2830 (two errors and =G 13770?); 2868 (=p. 2864?); 2870, 2915 (=p. 2916?); 2922 (=p. 2917?); 2955 (correction $+30^s$ and =p. 2962?); 2957 (=p. 2947?); 2977 (=p. 2985?); 2979 (=p. 2981?); 3020, 3024, 3039, (=G 14332?); 3041 (=p. 3040?); 3042 (=G14332?); 3056 (=p. 3052?); 3066 (=p. 3076?); 3067 (=p. 3075?); 3090, 3115, 3150, 3153 (=p. 3145?); 3165, (=p. 3170?); 3177 (=p. 3175?); 3252 (=p. 3248?); 3264, 3275, 3322 (=p. 3314?); 3326 (=p. 3317 or =p. 3325?); 3342 (error of 10′ in $\delta$?); 3344 (error in R.A. and =p. 3338? There is a star near the position of *p.*, however,—*viz.*, Z.C. No. 4072; Z.C. −p. = 20″ in declination. This star, however, seems somewhat too faint for p., as it is 9·6 in C.P.D., 9·0 in Z.C.); 3357, 3364, 3425, 3434, (error of 20″ in declination and =p. 3432?); 3438 (=p. 3437?); 3442, 3451, 3458 (=p. 3444?); 3460, 3552 (=p. 3553?); 3577 (=p. 3578?); 3587 (=p. 3584?); 3615 (=p. 3618?); 3622, (=p. 3619?); 3630 (=p. 3631?); 3672, 3695 (=p. 3693?); 3704, 3708 (=p. 3710?); 3757, 3762, 3774 (=p. 3776?); 3784, 3863 (=p. 3857?); 3906, 3937 (=p. 3933?); 4011, 4015 (=p. 4018?); 4025 (=p. 4024?); 4026, 4037, 4065, 4076, 4088, 4111, 4124, 4131, 4208, 4221, 4229 (these three stars all in error by about the same amount of error in C.P.D. and respectively =p. 4209 4223, 4228?); 4243, 4272 (=p. 4275?); 4347, 4348 (=p. 4349?); 4355 (=p. 4356?); 4357, 4379, 4392, 4430, 4451, 4486 (error of $1^\circ$ in $\delta$ and =G 18348?); 4563, 4601 (=p. 4599?); 4641 (=p. 4633?); 4652 (=p. 4656?); 4654 (=p. 4658?); 4732, 4744 (=p. 4743?); 4794, 4807 (=p. 4804?); 4817 (=p. 4818?);

4837, 4841, 4862, 4875, 4906 (=p. 4916?); 4910, 4921 (correction $-1^m$ in R.A. and =C.P.D. −38°, 3853?); 4983 (=p. 4986?); 4996, 5020 (=p. 5028?); 5034, 5117 (correction $-2^m$ in R.A. and =G 20163?); 5124, 5126 (=p. 5128?); 5132, 5142 (correction $-1^m$ and =G 20289?); 5154 (=p. 5155?); 5195 (error in R.A. and =G 20624?); 5210, 5211 (both seem to need a correction of about $20^s$ in R.A.; one of them =p. 5206); 5247 (=p. 5250?); 5253 (=p. 5251?); 5314, 5317 (=p. 5315?); 5467, 5493, 5506 (=p. 5505?); 5517 (correction of about $5^s$ or $6^s$ in R.A. and =G 21526?); 5525, 5599, 5616, 5631, 5639, 5642, 5649 (all three =G 22009?); 5657 (=p. 5658?); 5721, 5726 (=p. 5728?); 5820, 5877, 5929 (=p. 5927?); 5934 (=p. 5931?); 5940, 5954, 6020 (=p. 6022?); 6021, 6029, 6032, 6040, 6061, 6065, 6066, 6068, 6115, 6131, 6147, 6186, 6187 (there is a faint star 9·8 very near this position in C.P.D. Can this be *p.*'s star? variable?); 6191 (=p. 6192?); 6250, 6328, 6354 (probably 5′ in error in S.P.D. and =G 24855); 6383 (error of about $50^s$ in R.A. and =G 25026; declination agrees very closely); 6390, 6423, 6441 (=p. 6446?); 6447, 6475 (=p. 6477?); 6476 (=p. 6477?); 6545 (=p. 6550?); 6554, 6589, 6608 (=p. 6612?); 6610, 6631, 6684 (=p. 6681?); 6693, 6697, 6698, 6705, 6715, 6769 (=p. 6766?); 6783 and 6784 seem both in error by about $3^m$ $55^s$ and respectively (=p. 6795 and p. 6797); 6786 (=p. 6797?); 6791 (=p. 6794?); 6798 (=p. 6771?); 6920, 6938 (there is an error in the precision of R.A.); 6941, 6993 (=p. 6994?); 7026, 7032, 7092, 7109, 7242 (error of $-6^m$ and =G 31277?); 7329 (there is a star 7·9 at a distance of $6^s$ and 0′·7); 7347.

The stars of Brisbane referred to in G and S are not included in this list, although a few of these may perhaps have been wrongly identified.

## II. *bis*.—LIST OF STARS, 9·0 OR BRIGHTER, IN THE FIRST TWO PARTS OF THOME'S CORDOBA DM., AND MISSING ON THE PLATES.

| 61 | 9·0 | 34 47·3 | 31 18·8 | Both on measuring plate and check plate certainly missing. It is contained, however, on the preceding pair of plates ($6^h$ $24^m$), somewhat beyond the limit to which these plates have been measured for the C.P.D., mag. 9·5. The plates $6^h$ $48^m$ seem to be rather poor. At all events, those of $6^h$ $24^m$ contain a great deal more of stars on the overlapping portion. Besides measuring and check plate, there are available the plates 2165, 1304, and 1326; but the first of these is very dark, the two others too much in error to be of much use. |
| 62 | 8·9 | 35 34·9 | 31 19·8 | On plates $6^h$ $48^m$ perhaps faint traces of a star. On plates $6^h$ $24^m$ pretty bright, 9·4. See No. 61 for remarks about plates. |

## III. *bis.*—LIST OF STARS, 9·2 MAG. OR BRIGHTER, CONTAINED IN C.P.D., AND MISSING IN THE FIRST TWO PARTS OF THOME'S CORDOBA DM.

| No. | Mag. | α 1875. | δ 1875. | Remarks. |
|---|---|---|---|---|
| | | h m s | ° ′ | |
| 1 | 8·9 | 4 13 12·6 | 33 53·9 | Probably 10ˢ error in Thome and our star identical with Thome's (9·3) 13ᵐ 1ˢ·6 −33°.54′.5. |
| 2 | 9·2 | 42 52·6 | 29 0·2 | Perhaps 1° error in Thome and our star identical with Thome's (9·4) 42ᵐ 51ˢ·8 −28°.0′.0. |
| 3 | 9·0 | 45 39·2 | 28 37·2 | Probably 10′ error in Thome and our star identical with Thome's (9·3) 45ᵐ 40ˢ·4 −28°.46′.7. Looked up on plates. Three plates give 9·0 in perfect agreement. |
| 4 | 8·9 | 6 16 6·3 | 34 32·9 | Looked up on plates. Images normal. |
| 5 | 8·7 | 49 33·2 | 24 0·6 | The star is contained on six plates, which, reduced to a uniform scale, give the following magnitudes:—<br>Plate 2141 9·4 : 1889 February 27.<br>2146 9·4 : " " 28.<br>2157 8·6 " March 5.<br>2171 9·4 : " " 11.<br>2206 8·6 " " 26.<br>2228 9·9 : " April 3.<br>On the plates 2141, 2146, 2171, 2228, however, the star is very near the border of the plates; consequently the magnitudes are extremely uncertain. Still, however, variability seems very probable. |
| 6 | 8·9 | 7 4 46·4 | 32 43·6 | Looked up on plates. The star is contained on three plates. |
| 7 | 8·8 | 9 14·2 | 31 14·2 | Looked up on plates. The star is contained on three plates. |

* The check plate of the region −31½°, 22ʰ 48ᵐ is considerably fainter than measuring plate (*vide* Introd., p. (117)).

| 74 | 9·1 | 20 8 43·0 | 23 51·9 | The mags. of C.P.D. on plates 21½°, $20^h$ $20^m$, and for the stars of which the declination exceeds 23°.50′ of southern declination, are slightly uncertain, one of the plates being here evidently somewhat poor. For this reason the Zone −23°.50′ to −24°.0′, was measured also on the plates −26½°, $20^h$ $15^m$. On this plate, however, our star was found to be even rather somewhat brighter (mag. 9·0). The star is also missing in Orm. Stone's DM. |

# ERRATA.

The following list of errata, together with those of vol. i. p. (123) and vol. ii. p. xxxi, contain all the errors of the catalogue known up to the present date (July 1899). The same precautions as were described in vol. i. p. (123) were taken for vols. ii. and iii. against errors of reductions, copying, and printing.

That the list of errata is such a long one is again due in part to the frequent dropping out of the more unusual types, but by far the greater part to the corrigenda lately published for the catalogues to which references are given in the C.P.D., especially to the numerous corrigenda published by Thome, in the *Astronomische Nachrichten* and elsewhere, for the *Cordoba Catalogues*. In order to facilitate reference to these corrected positions, the source where the correction is to be found has been indicated.

The letters C.O. and A.N. stand respectively for *Cordoba Observations* and *Astronomische Nachrichten*.

(73) No. 59 to be omitted from list. The suggested identity may be considered certain. See C.O., XII. p. 347.

(73) No. 70 to be omitted from list. The suggested correction of 4′ in decl. certain. See C.O., XII. p. 347.

(73) No. 55. According to Thome, star does not exist. See A.N., No. 3539.

(74) No. 76 to be omitted from list. R.A. of Z.C. in error and star identical with Z.C. $10^h$, 1987. See C.O., XVII. p. 540.

(75) No. 87 to be omitted from list. The suggested identity with Z.C. $11^h$, 4088 certain. See C.O., X. p. 263.

(76) No. 111 may be omitted from list. Z.C. in error in R.A. and star = Z.C. $14^h$, 2811. See C.O., XVII. p. 540.

(77) No. 124. According to Thome, star variable. See C.O., XVII. p. 541.

(79) No. 152. Thome (C.O., XVII. p. 541) assumes an error in R.A. in Z.C., in order to make the position agree with that of a star of his DM. According to C.P.D., however, this identification implies another correction of 1′ in decl.

(80) No. 183 may be omitted from list. Decl. of Z.C. to be corrected to $58'.7''·6$ (C.O., XVII. p. 541). In this position there is a star (9·0) in C.P.D.

(81) No. 189 to be omitted from list. The position is that of Vesta (decl. being corrected to 37′). See C.O., XVII. p. 541.

(82) No. 207 to be omitted from list. Error in R.A. in Z.C. and star = Z.C. $21^h$, 1628. See C.O., XVII. p. 541.

(94) Line 14 from the bottom, remark (error of 1′ in decl.) to be omitted.
